singlesite−multidisturb−multipool−multipft

factorized−tau filter, 21 seeds x 25 years (525 filter steps)

steps with any dropped mass:	1 (1 seeds)
from collapsed importance weights:	1
from singular covariances:	0 (0 components in all)
largest mass dropped in one step:	5.04e−248
mean mass dropped per step:	9.59e−251

grid points with zero mass after dropping: 0 in all, in 0 steps (0 seeds)
active grid points per step: 35 − 36

Dropped mass: share of the forecast probability (over the tau blocks, history groups and scenarios) on components given zero weight before the update.
Zero−mass grid points: grid points all of whose components were dropped; they are restored at their prior weights (on unweighted placeholder moments).
